EXPERIMENT 07

Integrating a Zoho Creator Application with Another Zoho Service Using Connections and APIs

Vehicle Service & Repair Request Management

1. Aim

To integrate the Vehicle Service & Repair Request Management application developed in Zoho Creator with Zoho Calendar by creating an authorized connection and using a Deluge script to call the Zoho Calendar service. The integration automatically creates a calendar event when a vehicle owner successfully submits a service request, reducing the need for service-centre staff to manually schedule service appointments.

2. Procedure

Step 1: Open Microservices

The Microservices section was opened from the Develop menu of the Zoho Creator application. The Create New option was selected to configure a new service connection.

Step 2: Choose Connections

From the available microservice options, Connections was selected to establish communication between the Vehicle Service & Repair Request Management application and Zoho Calendar.

Step 3: Configure the Zoho Calendar Connection

A new connection named vehicle_service_calendar was configured for Zoho Calendar. The required authorization and access permissions were selected to allow the application to create calendar events.

Step 4: Authorize the Connection

Zoho Creator requested authorization to access Zoho Calendar. The required permissions were reviewed and the connection was authorized to enable communication between the two services.

Step 5: Enable the Connection for the Application

The created Zoho Calendar connection was enabled for the Vehicle Service & Repair Request Management application. This connection allows Deluge scripts to access the calendar service and create events automatically.

Step 6: Create the Workflow

A new workflow was created for the Service_Request_Form. The workflow was configured to execute when a record is created following a successful form submission.

This ensures that the calendar event is generated only after the vehicle owner's service request has been successfully submitted.

Step 7: Write the Deluge Script

A Deluge script was added to the workflow to communicate with Zoho Calendar through the authorized connection.

The script retrieves the submitted service request details, including the vehicle registration number, service type, preferred service date, and preferred drop-off time. These details are used to prepare the calendar event.

The event provides the service centre with a scheduled reminder of the requested vehicle service appointment.

Step 8: Save and Test the Workflow

The Deluge script and workflow were saved. A sample vehicle service request was submitted through the live form to test the integration.

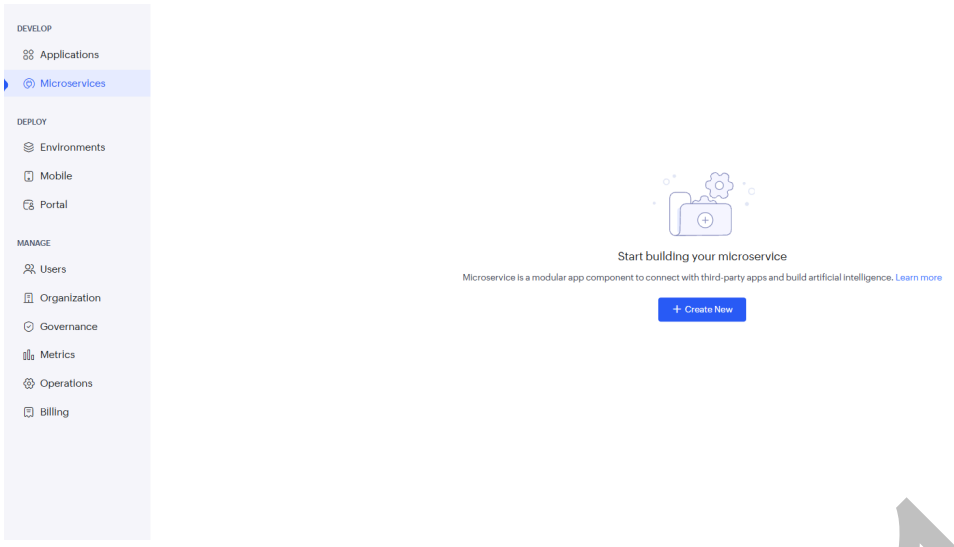

Zoho Calendar was then checked to verify whether the corresponding service appointment event had been created successfully.

3. Output

3.1 Opening the Microservices Section

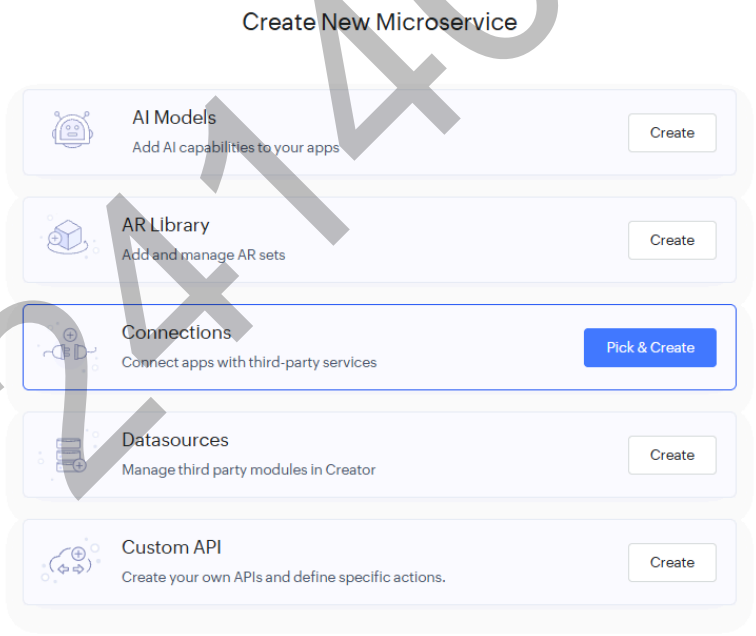

The Microservices section was accessed from the Develop menu in Zoho Creator. The Create New option was used to configure a new service connection.

24140101O

3.2 Choosing the Connections Microservice

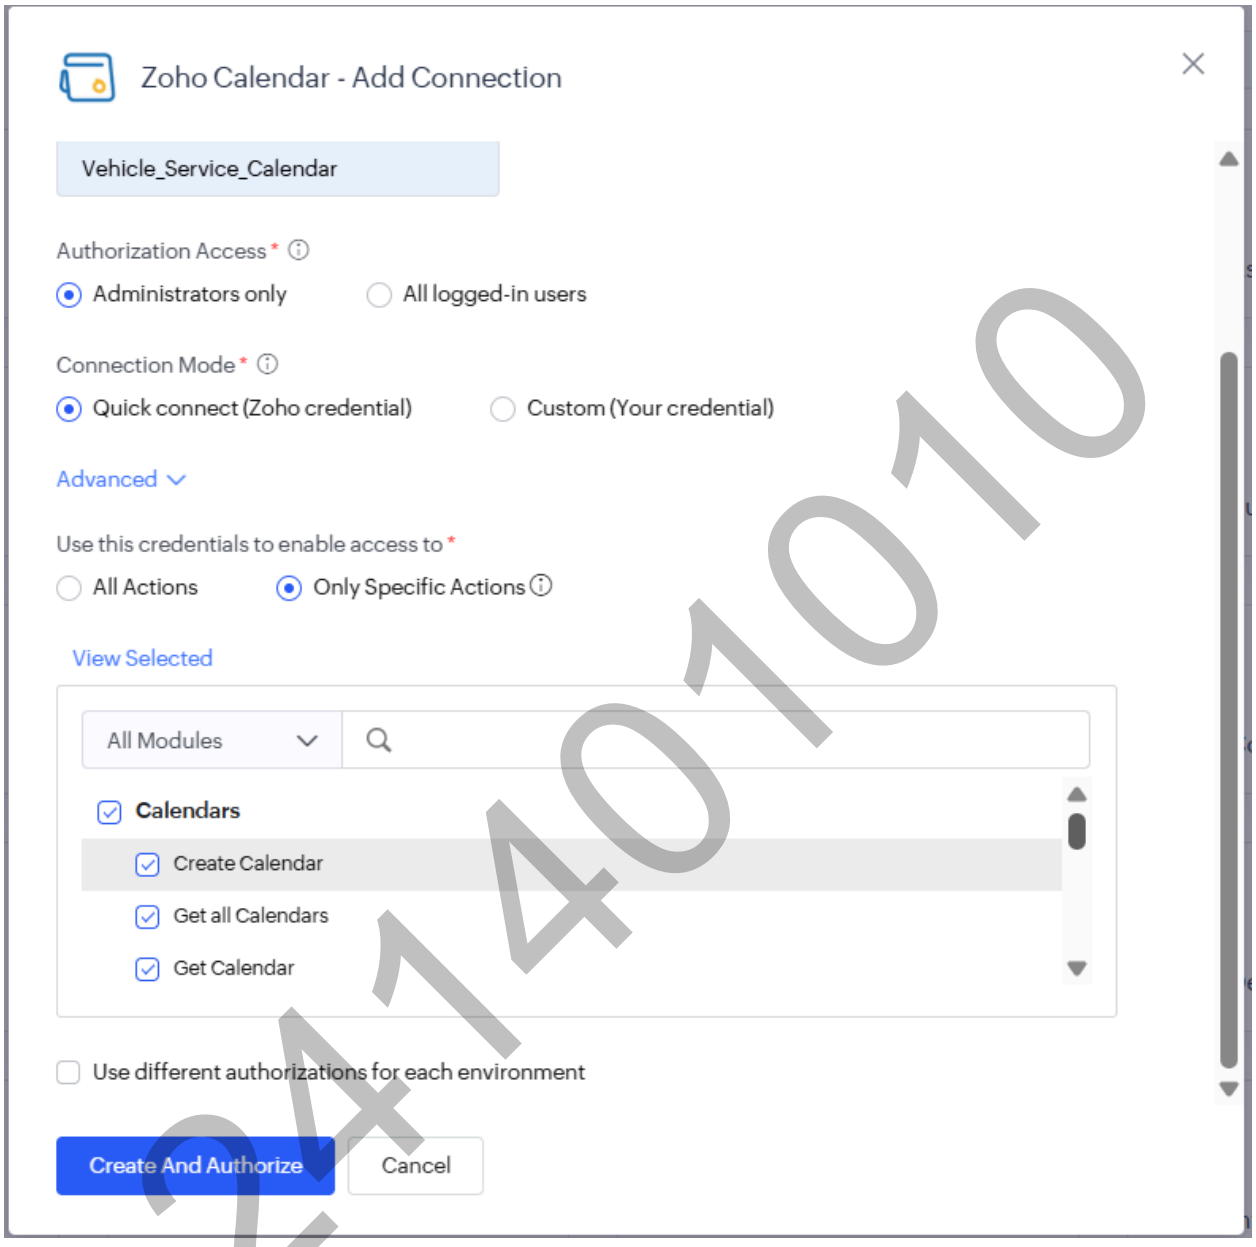

The Connections option was selected from the available microservice types to establish communication between Zoho Creator and Zoho Calendar.

3.3 Creating the Zoho Calendar Connection

2140101010

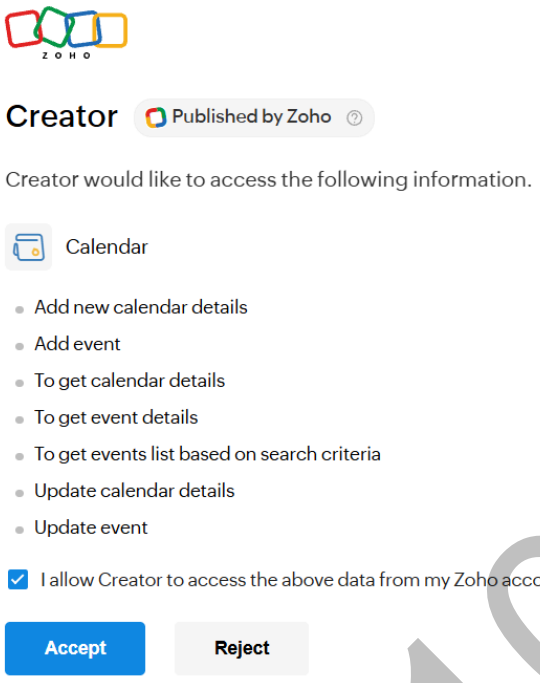

A Zoho Calendar connection named vehicle_service_calendar was configured by providing the required connection details and selecting the necessary permissions.

24140101O

3.4 Authorizing Zoho Calendar

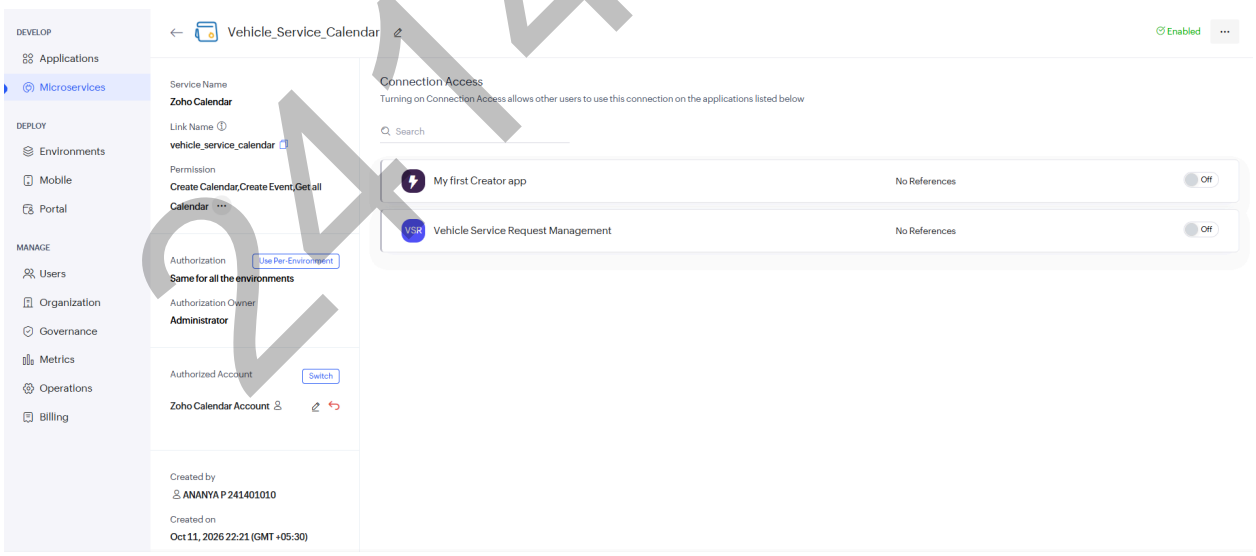

The connection was authorized by granting Zoho Creator the required permissions to access Zoho Calendar and create calendar events.

241401010

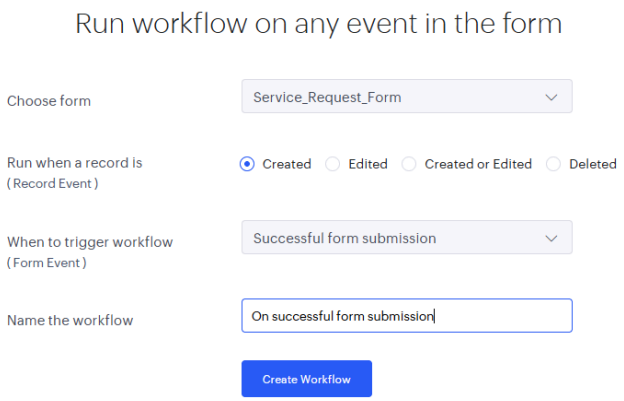

3.5 Connection Details and Access

The created Zoho Calendar connection was enabled for the Vehicle Service & Repair Request Management application. It provides the authorization required for the application to create calendar events through Deluge scripting.

3.6 Creating the Workflow

A workflow was created for the Service_Request_Form. The record event was set to **Created**, and the form event was configured as **Successful form submission**.

3.7 Deluge Script Calling Zoho Calendar

A Deluge script was added to the workflow to send the submitted service request details to Zoho Calendar. The script uses the authorized connection to create a corresponding calendar event containing the vehicle's service details and preferred appointment date.

24140101010

3.8 Testing the Calendar Integration

A sample service request was submitted through the live form. The corresponding event was checked in Zoho Calendar to verify that the integration was functioning as expected.

4. Final Result

The Vehicle Service & Repair Request Management application was integrated with Zoho Calendar using Connections and Deluge scripting.

When a vehicle owner successfully submits a service request, the configured workflow automatically creates a corresponding calendar event using the submitted appointment details. This helps the service centre organize service schedules, track upcoming appointments, and reduce manual calendar entries.

Thus, the objective of integrating a Zoho Creator application with another Zoho service using Connections, APIs, and Deluge scripting was achieved.
