Building Reports, Dashboards, and Custom Pages (UI Builder)

Vehicle Service Request Form

1. Aim

To build a supporting Report and a UI Builder Dashboard Page for the existing “Vehicle Service Request Form” application in Zoho Creator, allowing service-center staff to view, filter, group, and triage submitted service requests, and allowing new service requests to be submitted from a single unified screen.

2. Procedure

2.1 Building the Report

1. Open Reports in the left sidebar; Zoho Creator auto-generates a grid report from the form. Rename it “All Service Requests Report.”
2. On the report, configure Quick Filters for **Service_Type** and **Preferred_Service_Date** so staff can narrow down service requests interactively.
3. Group the report by **Service_Type** and enable record counts so requests are organized as Routine Service, Breakdown Repair, and Accident Repair for easy triage.
4. Create a Kanban report based on **Service_Request_Form**, group columns by **Service_Type**, and name it “Service_Request_Kanban.”

2.2 Building the Dashboard Page (UI Builder)

5. Go to Pages under UI Builder → click New Page → choose Blank Page → name it “Service Dashboard.”
6. Add a heading component titled “Service Center – Vehicle Request Triage Dashboard.”
7. Add a link/button to open the “All Service Requests Report.”
8. Drag a Button Component and configure it: Text = “Submit New Service Request,” Action = Open Form → Service_Request_Form.
9. Add a Chart Component plotting **Service_Type** against record count, to visualize the distribution of service requests.
10. Add a second Chart Component plotting **Vehicle_Type** against record count, to visualize the distribution of requests by vehicle category.
11. Arrange the layout top to bottom: heading → report link → submit button → service-type chart → vehicle-type chart.
12. Preview the page to confirm the report loads correctly, both charts render correctly, and the Submit New Service Request button opens the form.
13. Check Form, Report, and Page permissions under Settings for each user role, ensuring the intended roles have View/Add access, and publish the page if required.

3. Output

Owner_Name	Pickup_Address	Email_Address	Contact_Number	Vehicle_Registration_Number	Vehicle_Type	Odometer_Reading
Priya Venkatesan	21, Anna Nagar West, Chennai, TN, 600040	priya.venkat@example.com	+919876543210	TN 22 CJ 3344	SUV	62890
Suresh Kumar	5, Gandhi Road, Coimbatore, TN, 641001	suresh.kumar@example.com	+919087654321	TN 09 BZ 7789	Truck	31500
Ramesh Kannan	9, Cross Street, Salem, TN, 636001	rameshkannan@example.com	+919345066778	TN 34 AB 5678	Hatchback	45230

Figure 1. All Service Requests Report with Service_Type grouping and sample records.

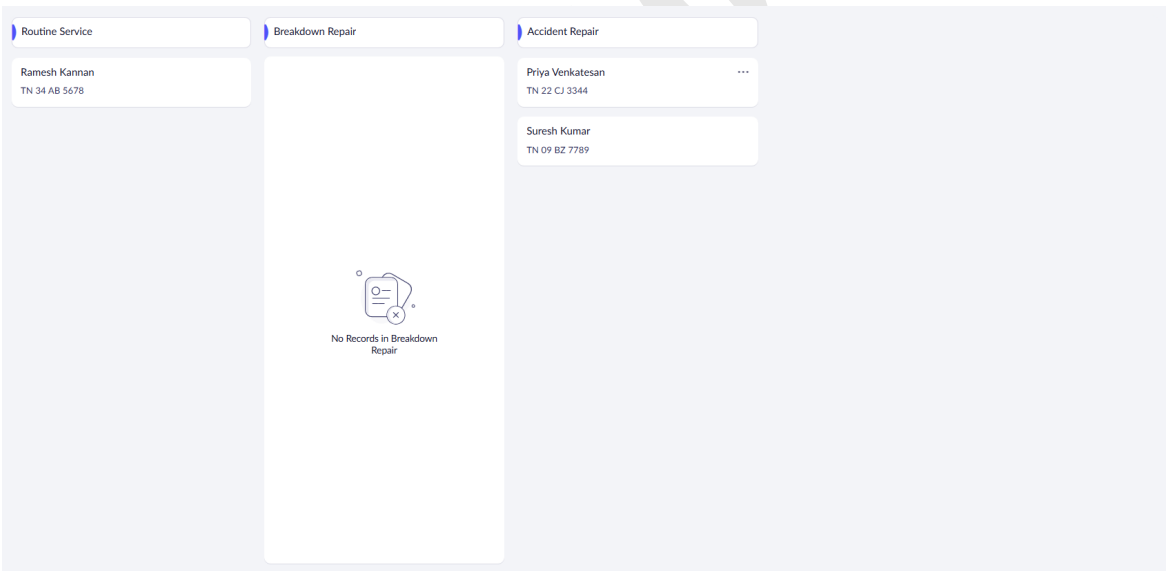

Figure 2. Service Request Kanban grouped by Service_Type.

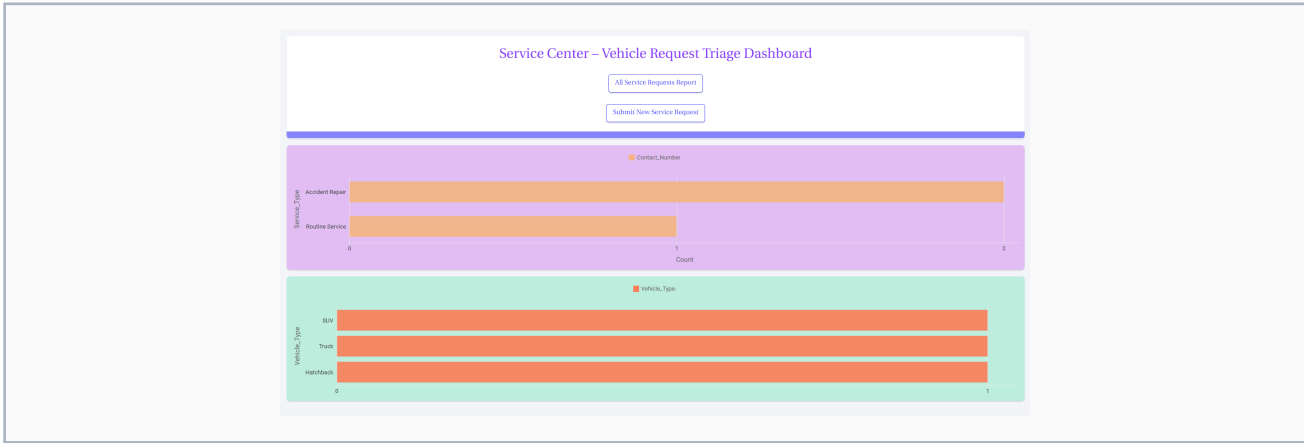

Figure 3. Service Dashboard (screenshot to be inserted).

4. Result

A filterable “All Service Requests Report,” grouped by service type, a Kanban-based “Service_Request_Kanban” report, and a consolidated “Service Dashboard” page with service-type and vehicle-type visualizations were successfully built using UI Builder for the existing Vehicle Service Request Form application. This enables service-center staff to review service-request patterns at a glance, filter and group incoming requests, and submit or review service requests from a unified digital workflow.

The final setup supports the vehicle service-center requirement by organizing requests by service category and preserving the submitted vehicle, owner, contact, issue, and scheduling information for triage and follow-up.
