EXPERIMENT 06

AUTOMATING BUSINESS PROCESSES USING DELUGE SCRIPTING AND WORKFLOWS, WITH APPLICATION TESTING AND DEBUGGING

VEHICLE SERVICE REQUEST MANAGEMENT SYSTEM

Aim

To automate the vehicle service request process by sending an acknowledgement email automatically when a customer successfully submits the Service Request Form, using a Zoho Creator workflow and Deluge script.

The automation eliminates the need for service centre staff to manually send acknowledgement emails and ensures that every valid service request is acknowledged immediately.

Procedure

Step 1: Create a Workflow

A new workflow was created for the `Service_Request_Form` from the Workflow section of the Zoho Creator application.

Step 2: Configure the Trigger

The Record Event was set to Created, and the Form Event was set to Successful form submission, so that the workflow runs after a valid form submission.

Step 3: Name the Workflow

The workflow was named Send Vehicle Service Acknowledgement Email and saved.

Step 4: Add a Deluge Action

A new action was added to the workflow. The action type was selected as Deluge Script so that a customized acknowledgement email could be generated using the submitted form data.

Step 5: Write the Deluge Script

A Deluge `sendmail` script was written to send an acknowledgement email to the vehicle owner's email address.

The email contains dynamic information such as:

- Vehicle Registration Number
- Vehicle Type
- Service Type
- Preferred Service Date

The values are retrieved directly from the submitted form fields. The email confirms that the service request has been received successfully.

Step 6: Save the Workflow

The Deluge script was saved, and the workflow was reviewed to ensure that the script was attached to the Successful form submission event**.**

Step 7: Test the Application

A sample vehicle service request was submitted through the live form using valid customer details, vehicle information, service requirements, and the preferred service date.

Step 8: Debug and Verify

The submitted record was checked in the `Service_Request_Report`, and the recipient's email inbox was checked after submission.

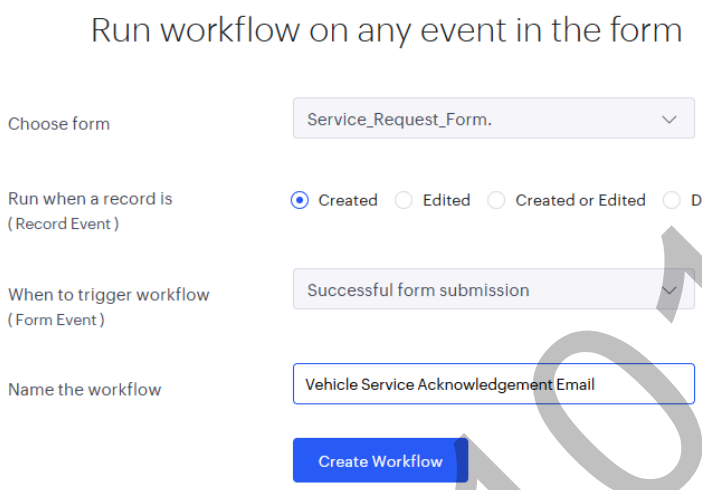

The acknowledgement email was received with the correct vehicle and service details, confirming that the workflow and Deluge script executed successfully.

Output

1. Creating the Workflow

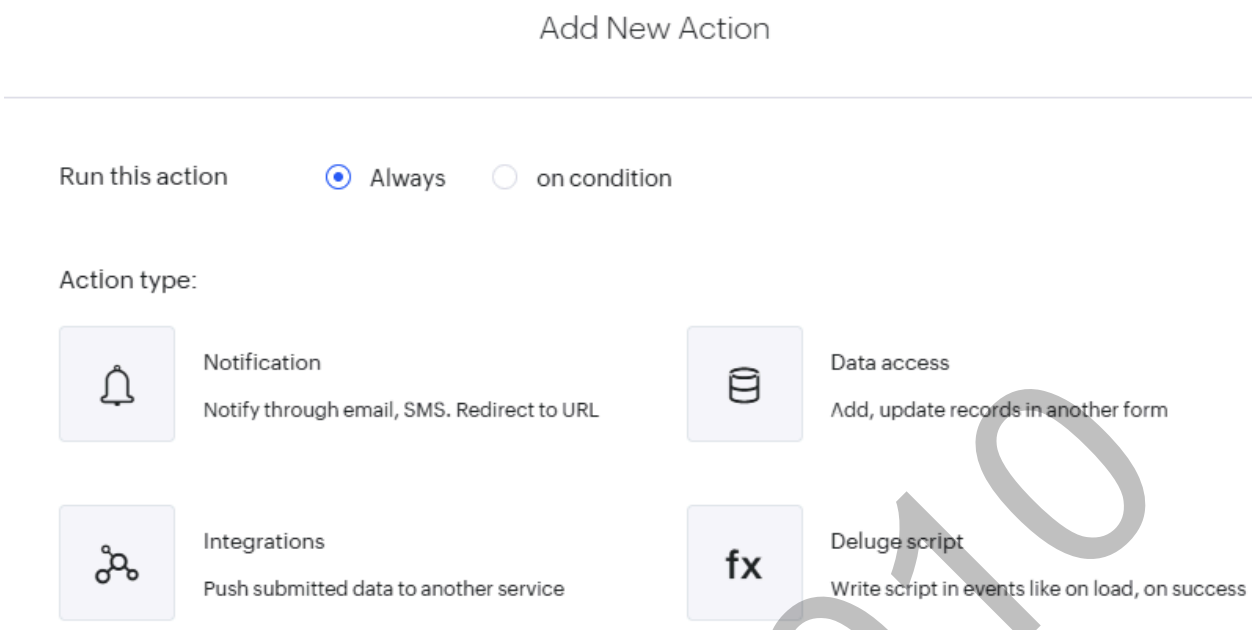

The workflow was created for the `Service_Request_Form` with the trigger set to Successful form submission.

24140101010

2. Choosing the Action

The Deluge Script action was selected to generate and send a customized acknowledgement email using the submitted service request details.

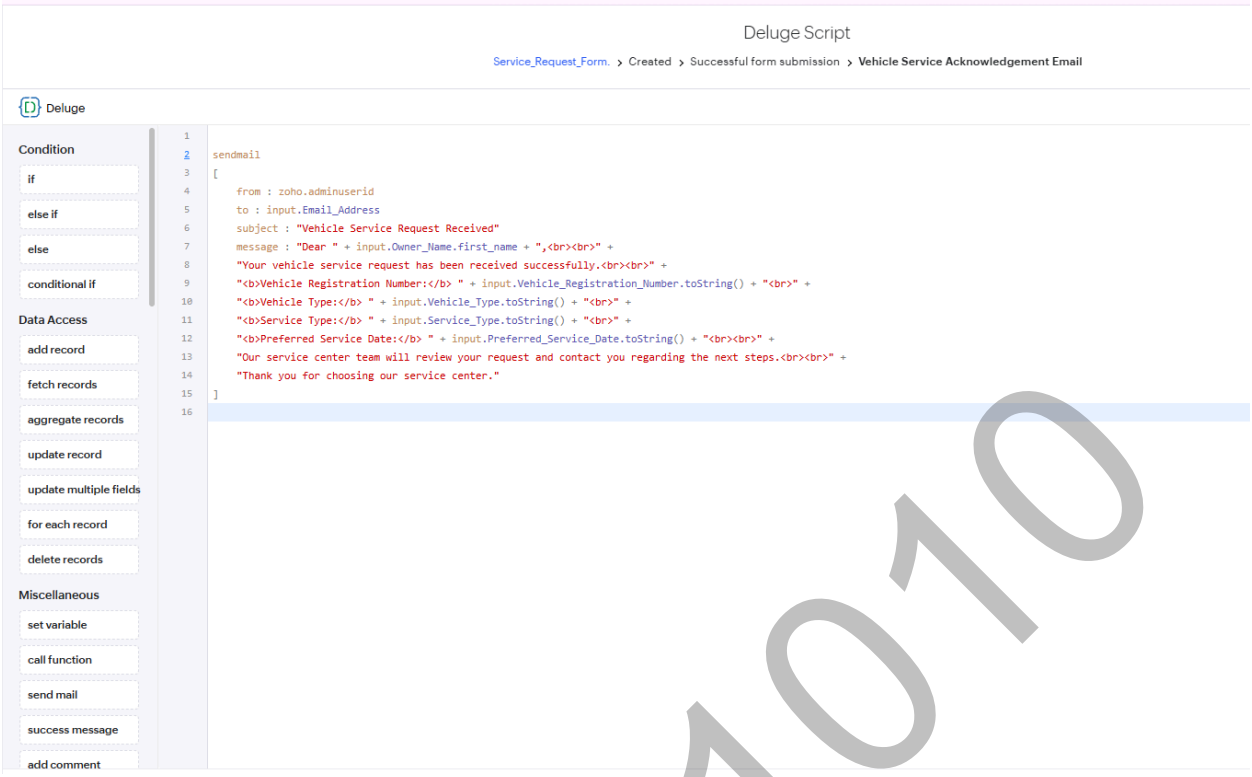

24140101010

3. Writing the Deluge Script

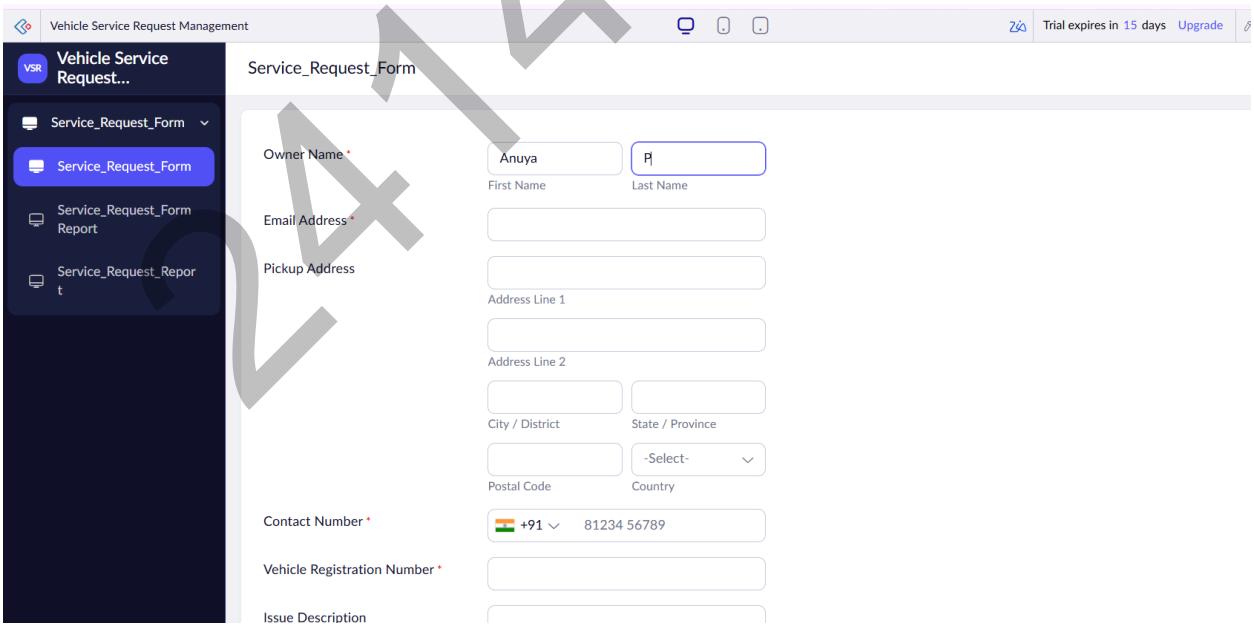

The `sendmail` script was configured with the customer's email address and dynamic vehicle service information from the submitted form.

The script uses the `Email_Address` field as the recipient and includes the owner's first name, vehicle registration number, vehicle type, service type, and preferred service date in the message.

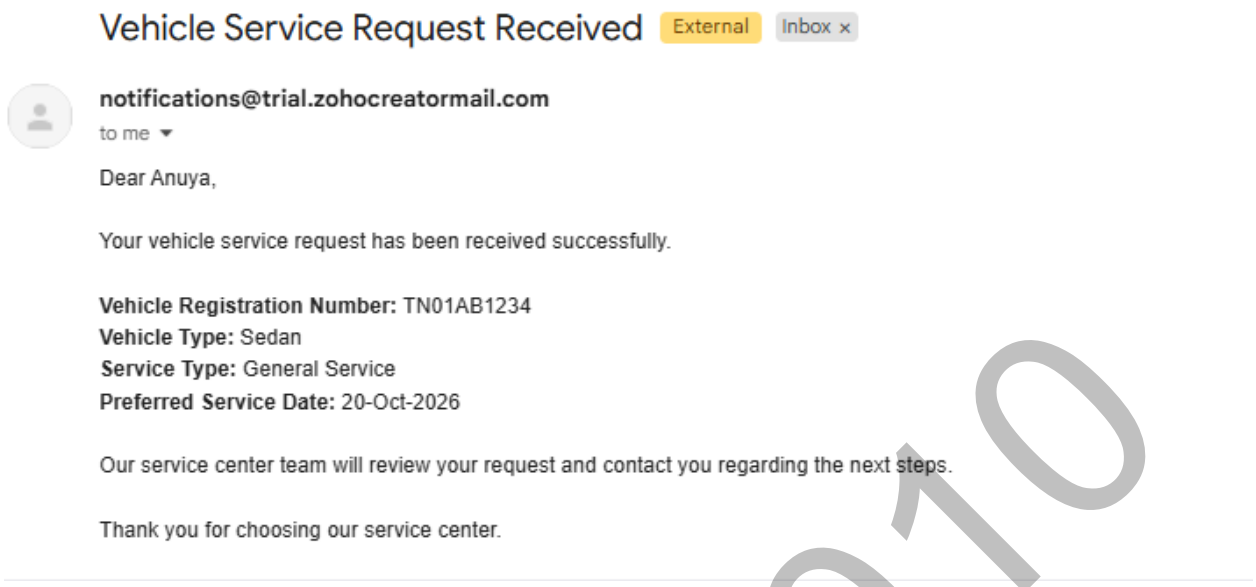

4. Testing the Service Request Form

A sample vehicle service request was submitted successfully through the live form to trigger the workflow. The submitted details were also checked in the service request report.

5. Acknowledgement Email

24140101010

The acknowledgement email was received successfully with the submitted vehicle service details. This demonstrated that the email automation worked correctly.

6. Service Request Report

The submitted vehicle service requests were displayed in the `Service_Request_Report`, allowing the stored records to be viewed and reviewed.

Final Result

A complete workflow was successfully implemented for the Vehicle Service Request Management application. The workflow automatically sends a personalized acknowledgement email whenever a customer successfully submits the vehicle service request form.

The application was tested using a live form submission. The submitted record appeared in the service request report, and the acknowledgement email was received with the correct details. Thus, the vehicle service request acknowledgement process was successfully automated using Zoho Creator Workflows and Deluge scripting.
