EXPERIMENT 8

User Management and Role-Based Access Control (RBAC)

Vehicle Service & Repair Request Management

Ananya P

1. Aim

To configure user management and Role-Based Access Control (RBAC) for the Vehicle Service & Repair Request Management application in Zoho Creator by creating appropriate user roles and assigning permissions to protect service-request records and administrative operations.

Objectives

• To review the Service_Request_Form and Service_Request_Report used to capture and manage vehicle service requests.

• To create distinct roles for service-center management and front-office staff.

• To assign different permissions for creating, viewing, editing, and deleting service-request records.

• To configure report and dashboard access for authorized users.

• To add test users, assign roles, and verify that role-based restrictions work as expected. • To understand

how RBAC helps protect customer contact details, vehicle information, and service records.

Software / Tools Required

• Zoho Creator (web-based low-code application development platform)
• Vehicle Service & Repair Request Management application
• Web browser with an active internet connection
• Zoho account with Edit access to the application

2. Introduction / Theory

User Management in Zoho Creator

User management determines who can access an application and what each user can view or do. Users can be assigned permission sets and roles to control access to forms, reports, pages, and records.

Role-Based Access Control (RBAC)

RBAC is an access-control model in which permissions are assigned to roles rather than separately to each individual user. Users receive the permissions associated with their assigned roles. This simplifies administration, supports least-privilege access, and helps maintain consistent security rules.

Key Concepts

Users	People added to the application who sign in to work with service-request forms and records.
Permissions	Access rights that determine whether a user can create, view, edit, or delete records and access reports or dashboards.
Roles	Organizational positions, such as Service Center Manager and Front Office Staff, used to group users with similar responsibilities.
Role Hierarchy	A structure that defines reporting relationships and can influence which lower-level records are visible to higher-level roles, depending on configuration.
Data Sharing	A rule that allows records to be shared with another role or user, with a defined level of access where supported.

Application Specifications

Application Name	Vehicle Service & Repair Request Management
Primary Form	Service_Request_Form
Report View	Service_Request_Report
Primary Users	Vehicle owners, service-center front office, and technicians
Roles	Service Center Manager and Front Office Staff
Manager Access	Create, view, edit, and delete service-request records; full report access.
Staff Access	Create, view, and edit service-request records; deletion restricted; report access as configured.

3. Procedure

Step 1: Open User Management

Open the Vehicle Service & Repair Request Management application in Zoho Creator and navigate to the Users and Permissions or equivalent user-management settings.

Step 2: Create Roles

Create two roles for the application: **Service Center Manager** and **Front Office Staff**.

Step 3: Configure Manager Permissions

Give the Service Center Manager full access to service-request records, including creating, viewing, editing, and deleting records. Allow access to the Service_Request_Report.

Step 4: Configure Staff Permissions

Give Front Office Staff permission to create, view, and edit service-request records. Restrict deletion so that important records cannot be removed by staff users.

Step 5: Configure Report Access

Configure access to Service_Request_Report. Provide full access to the manager and view access to staff, unless the application's requirements call for a different setting.

Step 6: Configure Dashboard or Page Access

If a dashboard or page is part of the application, make it available to both roles only when needed for their responsibilities. The supplied use case specifies the report view; a dashboard is optional.

Step 7: Add Users

Add test users and assign each user to the corresponding role. Use separate accounts when testing the different permission levels.

Step 8: Test Role-Based Access

Sign in or test the application as each role. Verify whether each role can create, view, edit, and delete records according to the configured permissions.

Step 9: Verify Restricted Access

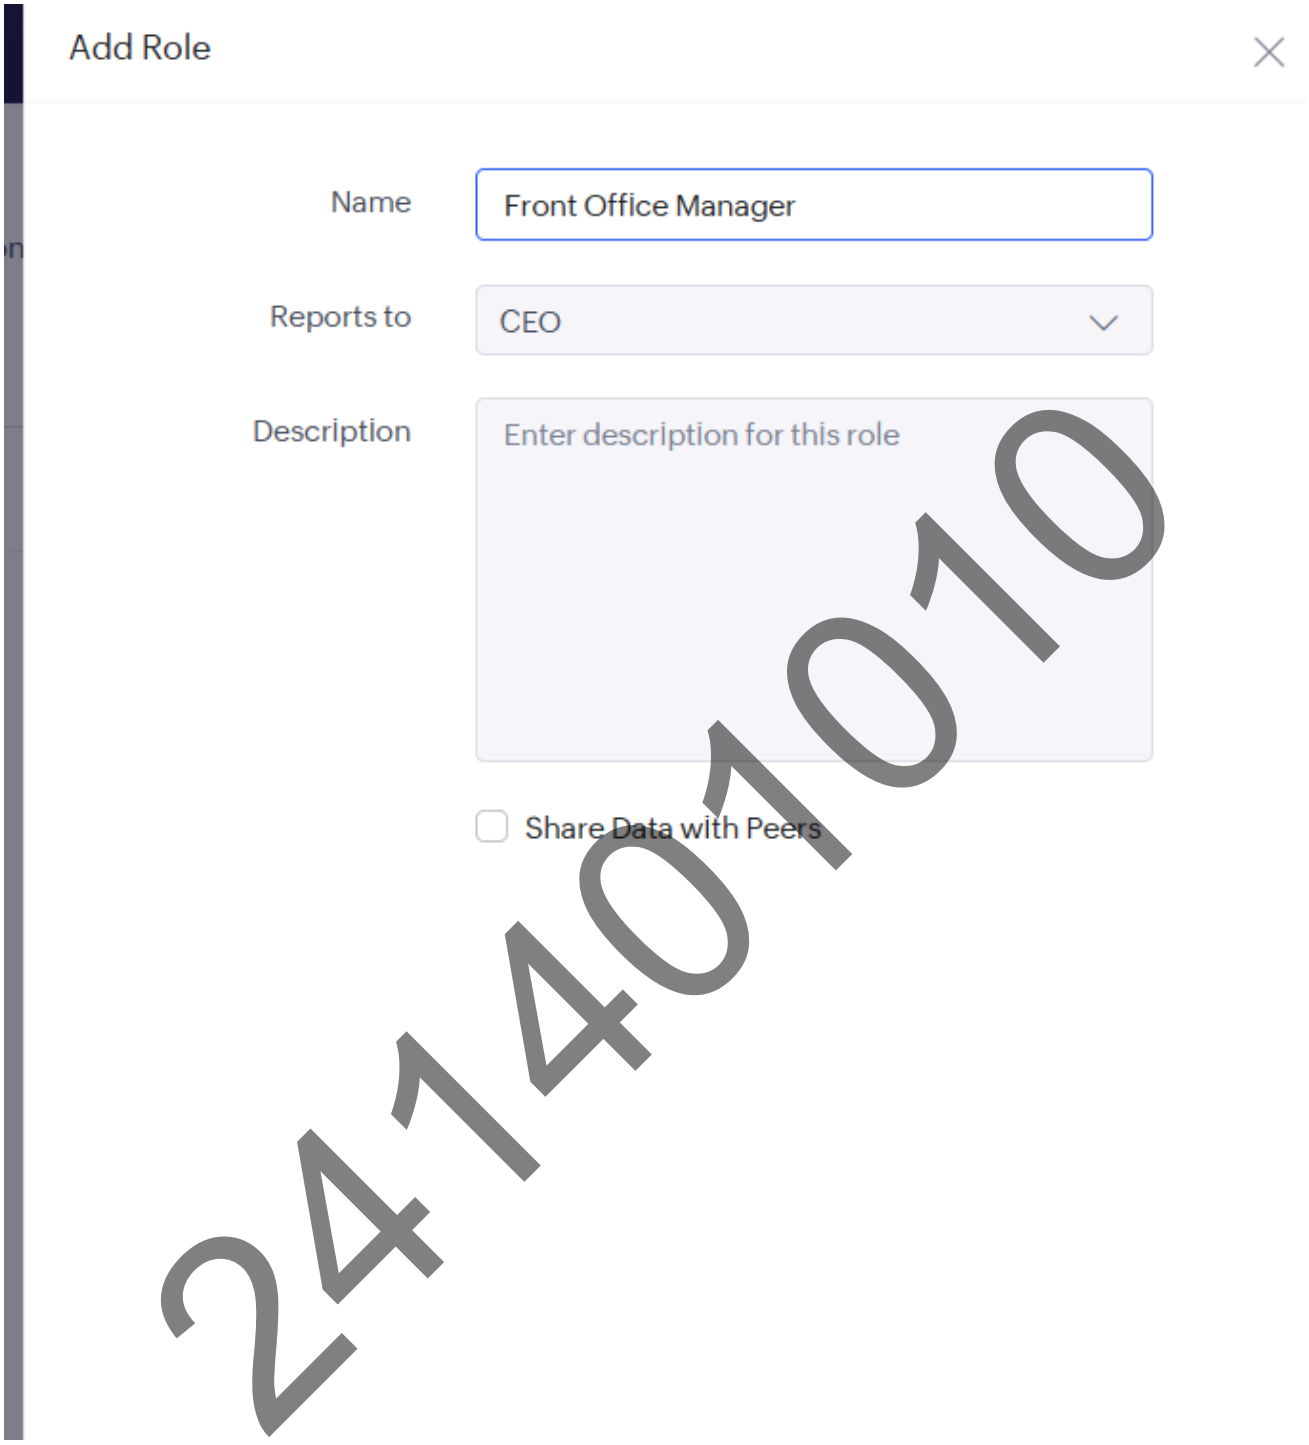

Using the Front Office Staff account, confirm that deleting a service request and accessing user-administration settings are blocked. Record the results with screenshots.

4. Output

4.1 Creating User Roles

2140101010

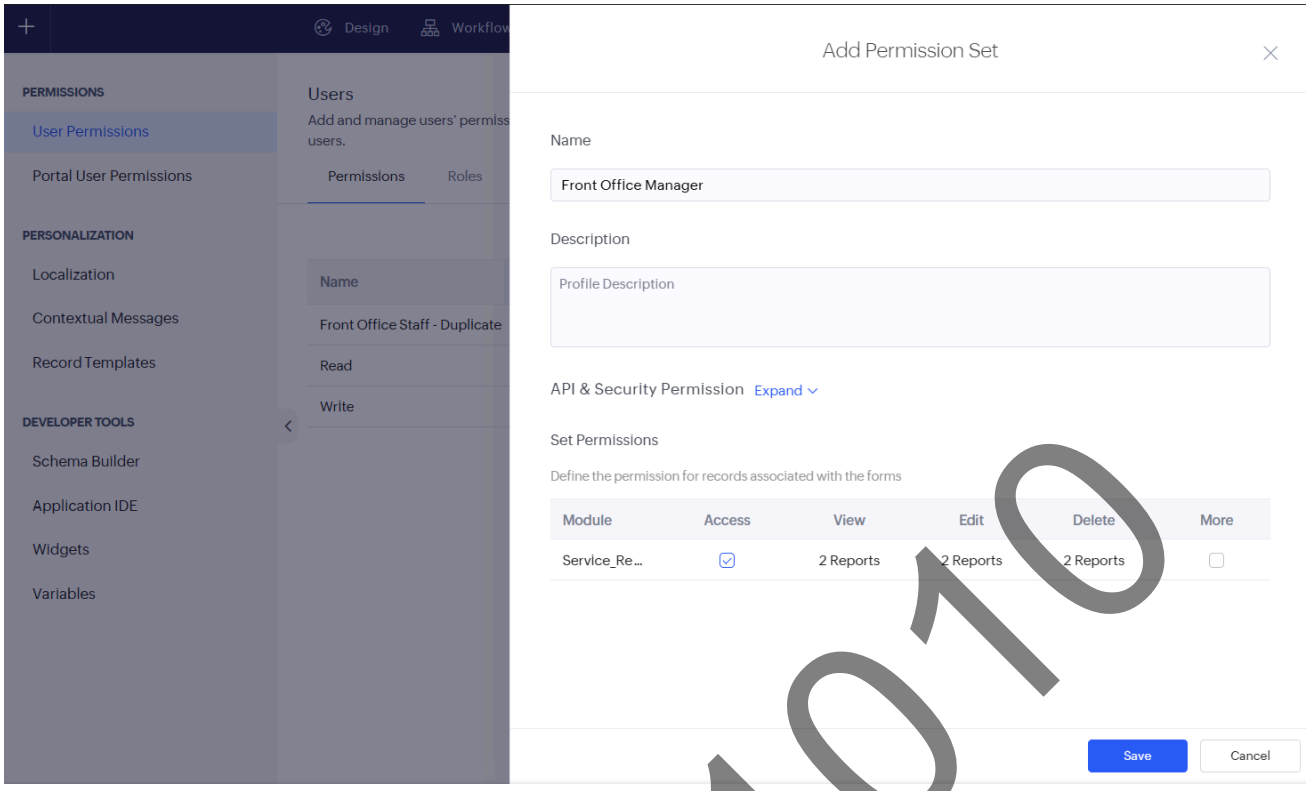

The roles Service Center Manager and Front Office Staff were created for the Vehicle Service & Repair Request Management application.

24140101010

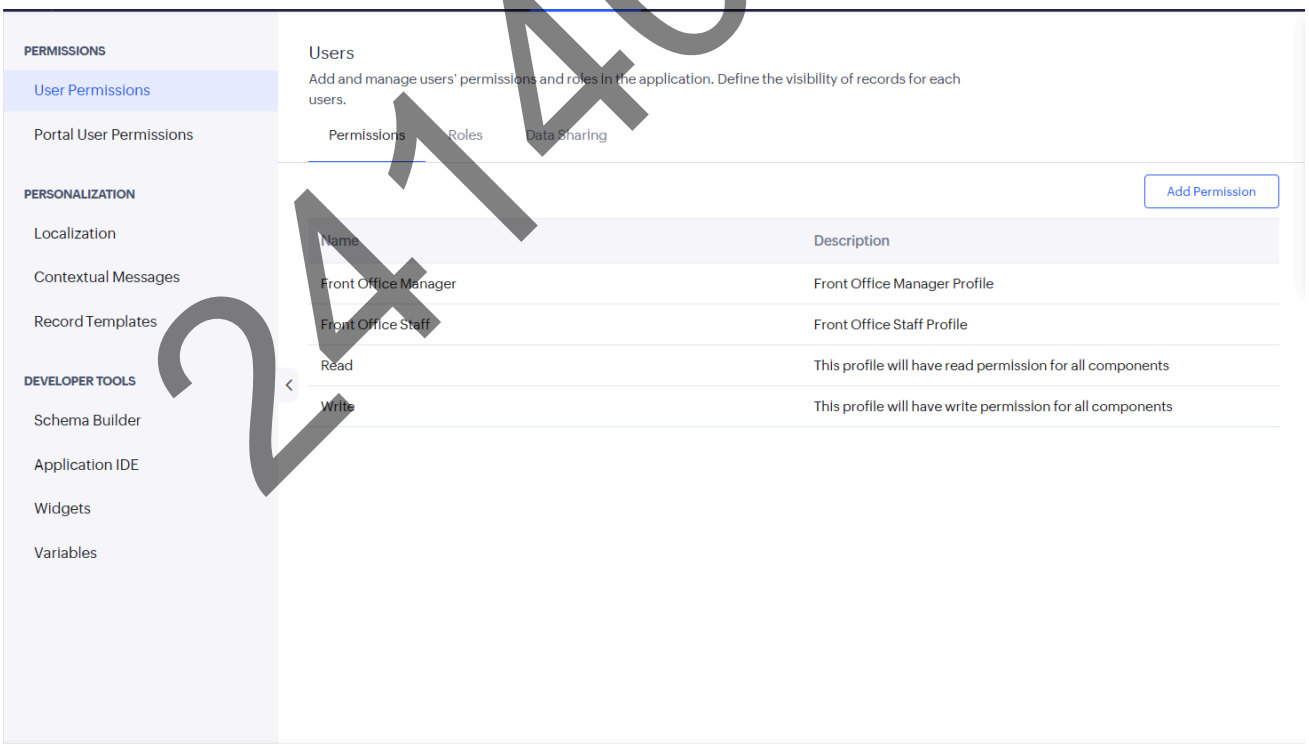

4.2 Configuring Manager Permissions

The Service Center Manager was assigned permission to create, view, edit, and delete service-request records and access the report.

4.3 Configuring Staff Permissions

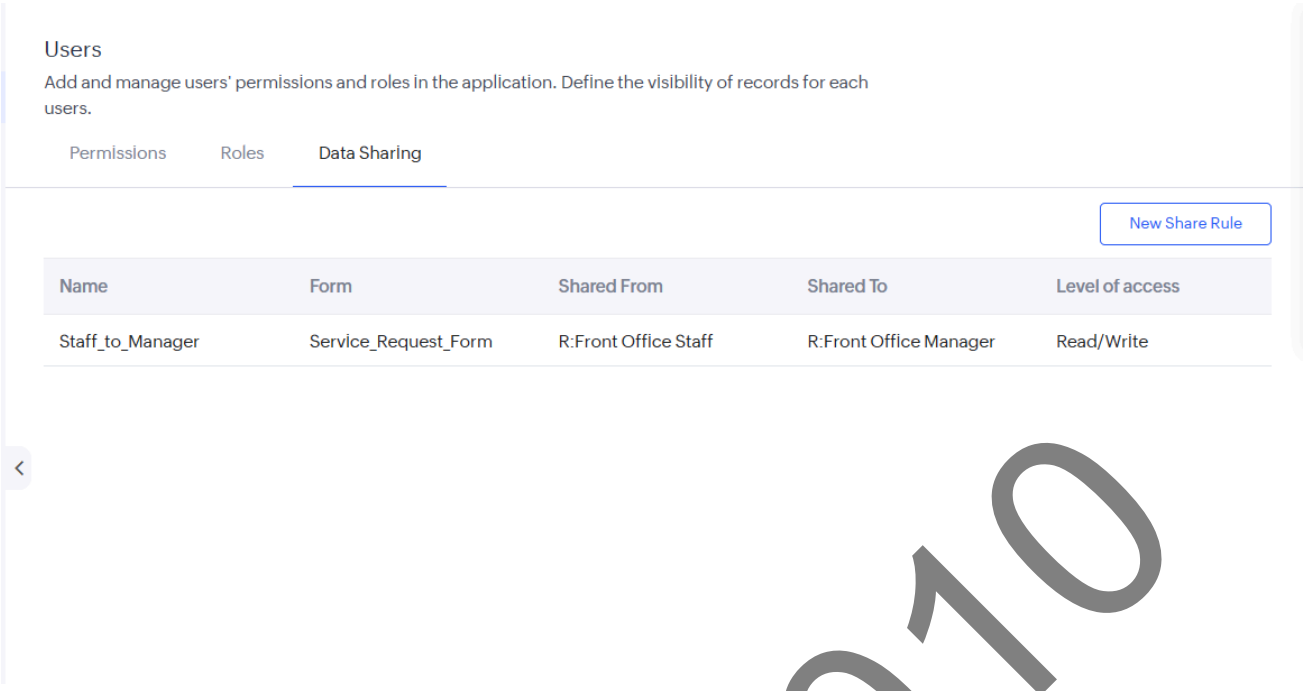

Front Office Staff was assigned limited access: create, view, and edit service requests, without permission to delete records.

4.4 Adding Users and Testing

Test users were assigned to their respective roles, and their access to the form and report was checked against the configured permissions.

24140101O

5. Final Result

User management and Role-Based Access Control (RBAC) were configured for the Vehicle Service & Repair Request Management application. The Service Center Manager was assigned full access to service-request records, while Front Office Staff was given restricted access without deletion permission. The configuration was verified by testing the application with users assigned to the two roles.
