Experiment 11

Deployment of Zoho Creator Application from Development to Stage and Production

Ananya P
241401010

Aim

To deploy the Vehicle Service & Repair Request Management application in Zoho Creator from the Development environment to the Stage environment for testing and then to the Production environment for live use.

Procedure

1. Open Zoho Creator and select the Vehicle Service & Repair Request Management application.

2. Open the Service_Request_Form and make a small modification, such as adding an instruction asking users to verify their vehicle and contact details before submitting the form. Save the changes.

3. Navigate to the Deploy menu and select Environments to view the available deployment environments and changes.

4. Select Publish to Stage to begin deploying the modified application to the Stage environment.

5. Select the required modified components and compare the changes before publishing.

6. Enter the deployment details, including the title, description, version type, and email notification details, if requested.

7. Click the appropriate Publish or Deploy option to deploy the selected components to the Stage environment.

8. Verify that the deployment is completed successfully. Open the Stage application and test the form to ensure that it works correctly.

9. After successful testing, navigate to the deployment section and select Publish to Production, if available.

10. Review the selected components and confirm the production deployment.

11. Verify the deployment status and check whether the application is available in the Production environment.

OUTPUT

3.1 Multi-stage deployment model

Multi-Stage Deployment Flow in Zoho Creator

Zoho Creator provides three environments. Development is where the application is built, Stage is a testing copy, and Production is the live copy used by end users. A change is published to one environment at a time, so untested work never reaches live users.

3.2 Application overview (Development environment)

The Vehicle Service & Repair Request Management application was opened in the Development environment. It contains the form Service_Request_Form, the report Service_Request_Report that lists the submitted service requests, and the Service Center Vehicle Request Triage Dashboard, which summarises total requests, unique vehicles, oil changes and repairs along with charts by service type and vehicle type. A small instruction asking the owner to verify the vehicle and service details was added to the form before deployment.

3.3 Environments page

The Environments page, under the Deploy menu, lists the Vehicle Service Request Management application with Stage and Production columns. Production held version 1.0, while the Stage column showed the application waiting for the development app to be created, indicating that Development had changes ready to publish. The Version History, Manage and Publish options are available at the top of the page.

3.4 Selecting Components and Comparing Versions

In the Publish to Stage window, the required components of the Vehicle Service & Repair Request Management application were selected for deployment. The code view displays the changes made to each component. The package (Default Package 1.0, Major) contained 28 components, created on 12-Oct-2026 at 20:52:28.

The selected components are the Service_Request_Form and its fields: the newly added plain-text instruction (“Please verify your vehicle and service details before submitting the request.”), Owner Name, Email Address, Service Type, Additional Services Requested, Pickup Address, Contact Number, Vehicle Registration Number, Issue Description and Odometer Reading, together with the other components shown in the package. They were reviewed to identify the changes before publishing the application to the Stage environment for testing.

3.5 Publish Details

The deployment title was entered as Vehicle Service Request Management, with the description “Initial deployment of the Vehicle Service Request Management application from the Development environment to the Stage environment for testing and validation.” The deployment type was set to Major (enhancements and updates), and the version changed from V1.0 to V2.0. Email notification was set to ananya.p.2024.csbs@rajalakshmi.edu.in to receive deployment updates. A warning was displayed indicating that the application will be set to maintenance mode and will be inaccessible until publishing is completed.

3.6 Stage deployment confirmation

After clicking Publish, Zoho Creator displayed “Publish to Stage initiated” and noted that the process takes a few minutes and that its status can be tracked on the Environments page.

3.7 Stage completion email and testing in Stage

A “Publish to Stage Completed” email from noreply@zohocreator.com confirmed that the version was published successfully to the Stage environment. The email listed the title Vehicle Service Request Management and the current version 2.0, and showed that the deployment was initiated on 12 Oct 2026 at 21:06 IST. The Stage application can then be opened and the Service_Request_Form tested to confirm that the validations and the new instruction work correctly before moving to Production.

3.8 Deployment Summary

Environment	Version	Date	Status	Description
Development	1.0	Oct 12, 2026	Deployed	Application configured and ready for deployment
Stage	2.0	Oct 12, 2026	Deployed	Application published to Stage for testing and validation
Production	1.0	—	Live	Current live version, available to end users

3.9 Deployment practices followed

The deployment followed good release practice: components were reviewed and the changes compared before publishing; each release carried a clear title, description and version type; email notification was enabled and received; the maintenance-mode warning was noted; and the Stage completion email was checked after publishing.

4. Final Result

The Vehicle Service & Repair Request Management application was deployed through the Zoho Creator multi-stage process. The selected components of the Service_Request_Form were reviewed and published from Development to Stage as a Major release, upgrading the application from version 1.0 to version 2.0. The Stage completion email confirmed that the deployment was successful.

The exercise met its objective of deploying a Zoho Creator application from the Development environment to the Stage environment using controlled and traceable steps.
